Or resident's level of dependency across a Care Home Staffing Model The Care Home Staffing Model (CHSM) is an Excel-based tool which summarises the functional needs (or dependency) of individual residents based on the care home Indicator of Relative Need or ioRN measure.. This is then used to show how resident dependency and care hours for the home compare against an equivalent care home.. Comparison of Rhys Hearn method of determining nursing staff requirements with the Aberdeen formula.. The CHSM tool also produces an aggregate ioRN score for the home by combining the ioRN information for every resident. 6e4e936fe3 [Sybase zentrale sql irgendwo 12](#)
